

TECHNICAL INFORMATION

Static Seals | Spiral back-up ring Internal and External Sealing Type, BP

Description

Back-up rings have no intended sealing function. Instead, as their name indicates, they are protective and supporting elements made from extrusion-resistant materials which generally have a rectangular cross-section. They are installed in a groove together with an elastomer sealing element, preferably with a corresponding O-ring in static applications.

Due to the tight fit of the Back-up ring in the housing, they prevent extrusion of the pressurized elastomeric sealing element into the sealing gap.

Typical application examples are: injection moulding machines, machine tools, presses, excavators, agricultural machines and valves for hydraulic circuits.

Type BP has a rectangular cross-section and is made of PTFE. It consists of two spiral windings which are cut at the ends at an angle. It's used both static and dynamic applications is used in reciprocating movements. Dimensional stability of the O-ring improves the sealing force and increases the service life and is preferred for installations in a closed groove where uncut back-up rings are not suitable.

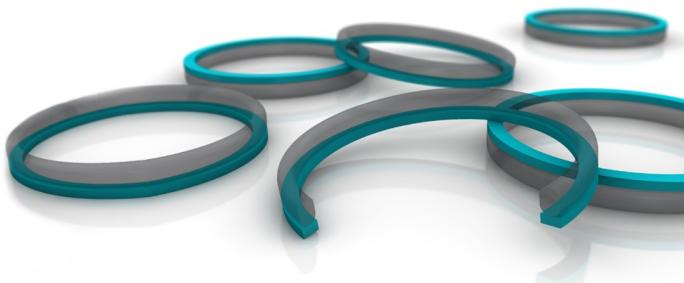

Advantages

- Rectangular cross section
- Material: PTFE
- Cut angle of 30° or 45°
- Consists as standard two spiral windings which are cut at the ends at an angle
- Static and dynamic use
- For reciprocating movements only
- Preferred for installations in a closed groove where uncut back-up rings are not suitable
- Compensation of large temperature changes and tolerances without difficulties by a screw-like elongation and contraction

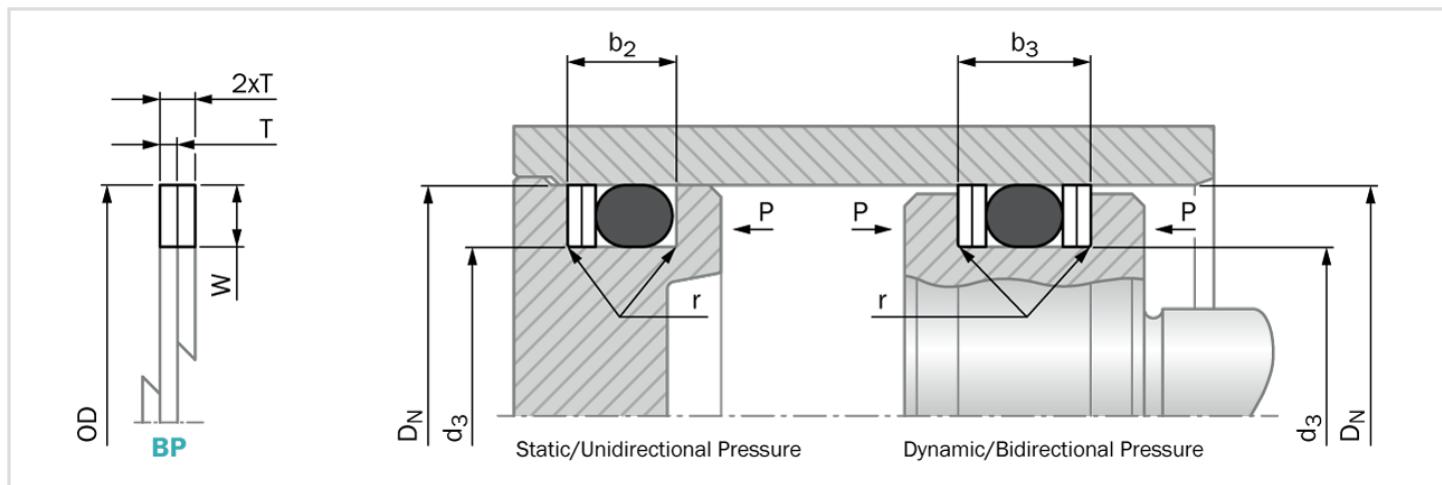

Technical Data

Static applications	:	Up to approximately 250 MPa (depending on back-up ring material and sealing gap)
Dynamic applications	:	Reciprocating up to approximately 40 MPa Oscillating / slowly rotating up to approximately 15 MPa
Speed	:	Reciprocating or rotating up to approximately 2 m/s (depending on the material)
Temperature	:	-200 °C to +260 °C (depending on the material)
